[GCM11]

GCM11

MONDAY 22 MAY, MORNING

TIME

1 hour.

INSTRUCTIONS TO CANDIDATES

Write your Centre Number and Candidate Number in the spaces provided at the top of this page.

You must answer the questions in the spaces provided.

Do not write outside the boxed area on each page or on blank pages.

Complete in black ink only. **Do not write with a gel pen.**

Answer all six questions.

INFORMATION FOR CANDIDATES

The total mark for this paper is 60.

Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

Quality of written communication will be assessed in Question 3(c).

A Data Leaflet, which includes a Periodic Table of the Elements, is included in this question paper.

13537

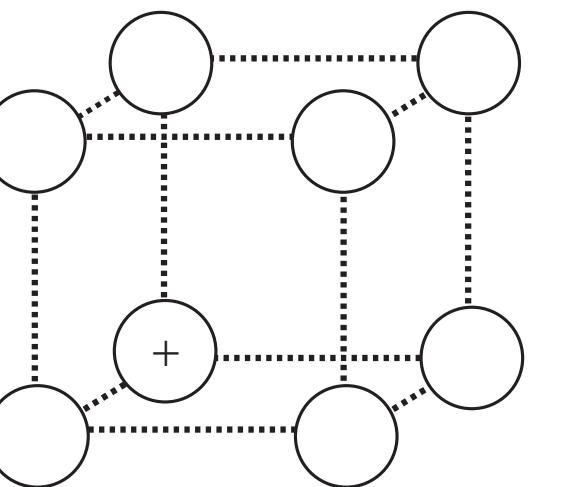

20GCM1101

- 1 A large underground salt mine in Carrickfergus supplies 750,000 tonnes of rock salt annually which is mainly used for de-icing roads in winter. Rock salt contains about 90% sodium chloride and some other minerals.

- (a) (i) Explain what is meant by a pure substance **and** why rock salt is not classified as a pure substance.

[2]

- (ii) A diagram of part of the structure of sodium chloride is shown below. Complete the diagram by adding the appropriate charges.

[1]

- (iii) What is the name for the type of structure shown for sodium chloride?

[1]

- (b) To extract the salt, a drill with a tungsten carbide tip bores into the rock. Tungsten carbide, for use in drills, is made by the reaction of tungsten metal with carbon at a high temperature.

- (i) Describe the bonding in a metal such as tungsten.

[2]

- (ii) Two of the isotopes of tungsten are ^{182}W and ^{183}W . Complete the table below to give information about atoms of these isotopes.

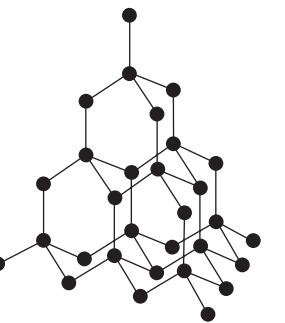

Atom	Mass number	Atomic number	Number of protons	Number of electrons	Number of neutrons
^{182}W		74			
^{183}W		74			

[2]

(iii) Diamond and graphite are two allotropes of carbon.

diamond

graphite

Complete the table below.

Allotrope	Type of bond between carbon atoms	Maximum number of bonds formed by each carbon atom
Diamond		
Graphite		

[2]

(iv) Which one of the following statements about diamond and graphite is true?
Circle the correct answer.

- A They are both good conductors of electricity
- B They are both soluble in water
- C They both are very hard
- D They both have high melting points

[1]

(v) Explain, in terms of structure, why graphite is used as a lubricant.

[2]

- (c) In the salt mine there are several safety chambers, one of which is shown in the photograph below. These provide protection for up to 20 people for several days in the event of an accident and have supplies of oxygen gas and water.

Source: Principal Examiner

Draw dot and cross diagrams to show the bonding in an oxygen molecule and the bonding in a water molecule.

oxygen

water

[2]

20GCM1106

2 Mixtures can be separated using different separating techniques.

(a) Some separating techniques are shown in the box below.

chromatography	crystallisation
simple distillation	filtration
	fractional distillation

Complete the table by giving the most appropriate separating technique.

Separation	Separating Technique
Sand from a mixture of sand and water	
Pure water from sea water	
Potassium chloride from aqueous potassium chloride	
Ethanol from a mixture of ethanol and water	

[4]

[Turn over

- (b) When a mixture of ethanol and water is separated, two colourless liquids A and B are obtained. Liquid A is ethanol containing a small amount of water. Liquid B is pure water.

(i) Describe a chemical test to show that liquid A contains water.

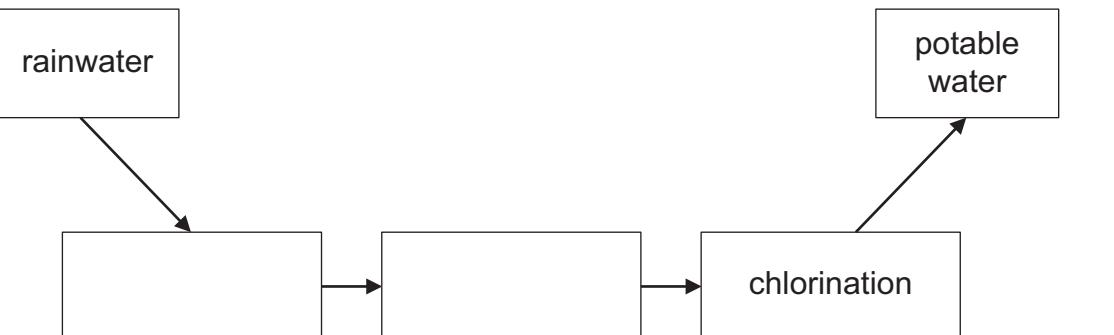

[2]

(ii) Describe how you would show that liquid B is **pure** water.

[1]

(iii) Complete the diagram to give the processes which convert rainwater into potable water using the words in the box below.

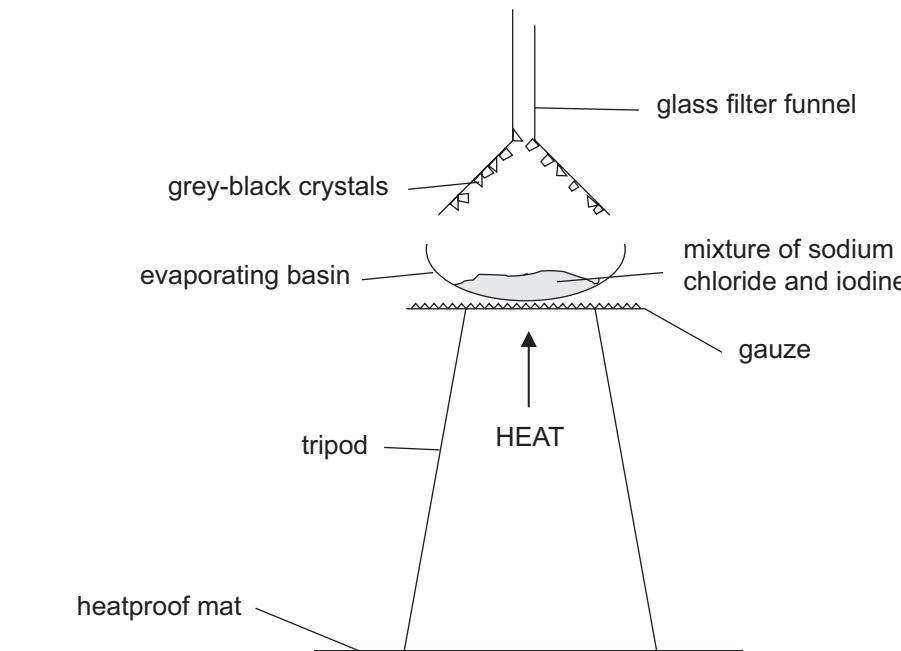

desalination dissolving filtration sedimentation

[2]

- (c) To separate a mixture of sodium chloride and iodine, the apparatus shown in the diagram below was set up. The mixture was heated for a few minutes and a purple gas was produced. Grey-black crystals formed on the filter funnel.

(i) Name the purple gas.

[1]

(ii) What change of state is occurring?

[1]

[Turn over

3 Crystals of hydrated sodium sulfate, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$, may be prepared using the following chemicals:

- sodium hydroxide solution
- sulfuric acid
- phenolphthalein indicator

In the laboratory 25.0 cm^3 of sodium hydroxide solution were pipetted into a conical flask. A few drops of phenolphthalein were added. Sulfuric acid was added until the indicator changed colour. The volume of acid needed to neutralise the alkali was 20.1 cm^3 .

(a) State the colour change observed in this experiment.

From _____ to _____ [2]

(b) Write a balanced symbol equation for this reaction.

_____ [3]

- (c) Describe how you would continue the experiment to obtain pure, dry crystals of hydrated sodium sulfate.

In this question you will be assessed on your written communication skills including the use of specialist scientific terms.

[6]

- (d) Calculate the percentage of water of crystallisation by mass in hydrated sodium sulfate, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$. Use the equation below.

$$\% \text{ of water of crystallisation} = \frac{\text{mass of water in 1 mole of hydrated compound}}{\text{mass of 1 mole of hydrated compound}} \times 100$$

% of water of crystallisation = _____ % [2]

[Turn over

- 4 Elephant calves are dependent on their mothers' milk for two years. At an elephant orphanage in Kenya, baby elephants are fed bottles of milk made from a specialist formula milk powder which contains a large proportion of sugars, fats and amino acids.

Source: Principal Examiner

- (a) One of the sugars found in elephant formula milk has the formula $C_6H_{12}O_6$. What is the empirical formula of this sugar?

[1]

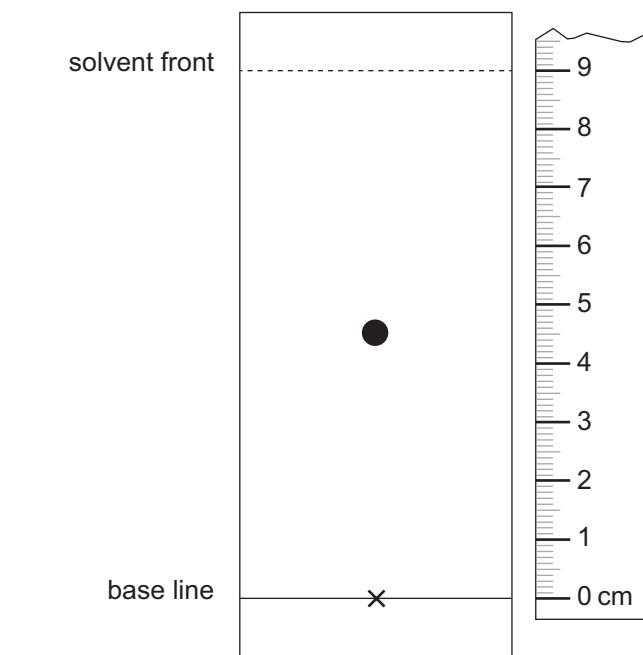

- (b) A sample of the elephant formula milk was analysed using paper chromatography to determine which amino acids were present.

- (i) Name the stationary phase in this chromatography.

[1]

- (ii) The chromatogram for one of the amino acids is shown below. Calculate the R_f value for this amino acid.

Show your working out.

$$R_f = \underline{\hspace{2cm}} [2]$$

[Turn over

(c) During the day, elephants flick soil onto their backs as protection from the sun. Humans use sun cream as protection from the sun. The sun creams may contain nanoparticles.

(i) What size is a nanoparticle?

[1]

(ii) State one benefit of using nanoparticles in sun creams.

[1]

(d) Hipposudoric acid is a red pigment found in the sweat of a hippopotamus which acts as natural protection from the sun. This acid is a weak acid.

(i) Suggest a value for the pH of hipposudoric acid.

[1]

(ii) Name the ion present in all acids.

[1]

- 5 The halogens are elements found in Group 7 of the Periodic Table. They are often used in disinfectants and can be obtained from different minerals or salts.

- (a) Three statements about the halogens are shown below. Each statement contains **one incorrect word**.

Statement 1: The colour of the elements becomes lighter down the group.

Statement 2: The elements form ions with a single positive charge.

Statement 3: Bromine is a red-brown gas at room temperature.

Complete the table, giving the incorrect word in each statement and the correct word to replace it.

Statement	Incorrect word	Correct word
1		
2		
3		

[3]

- (b) Explain why the halogens become less reactive down the group.

[3]

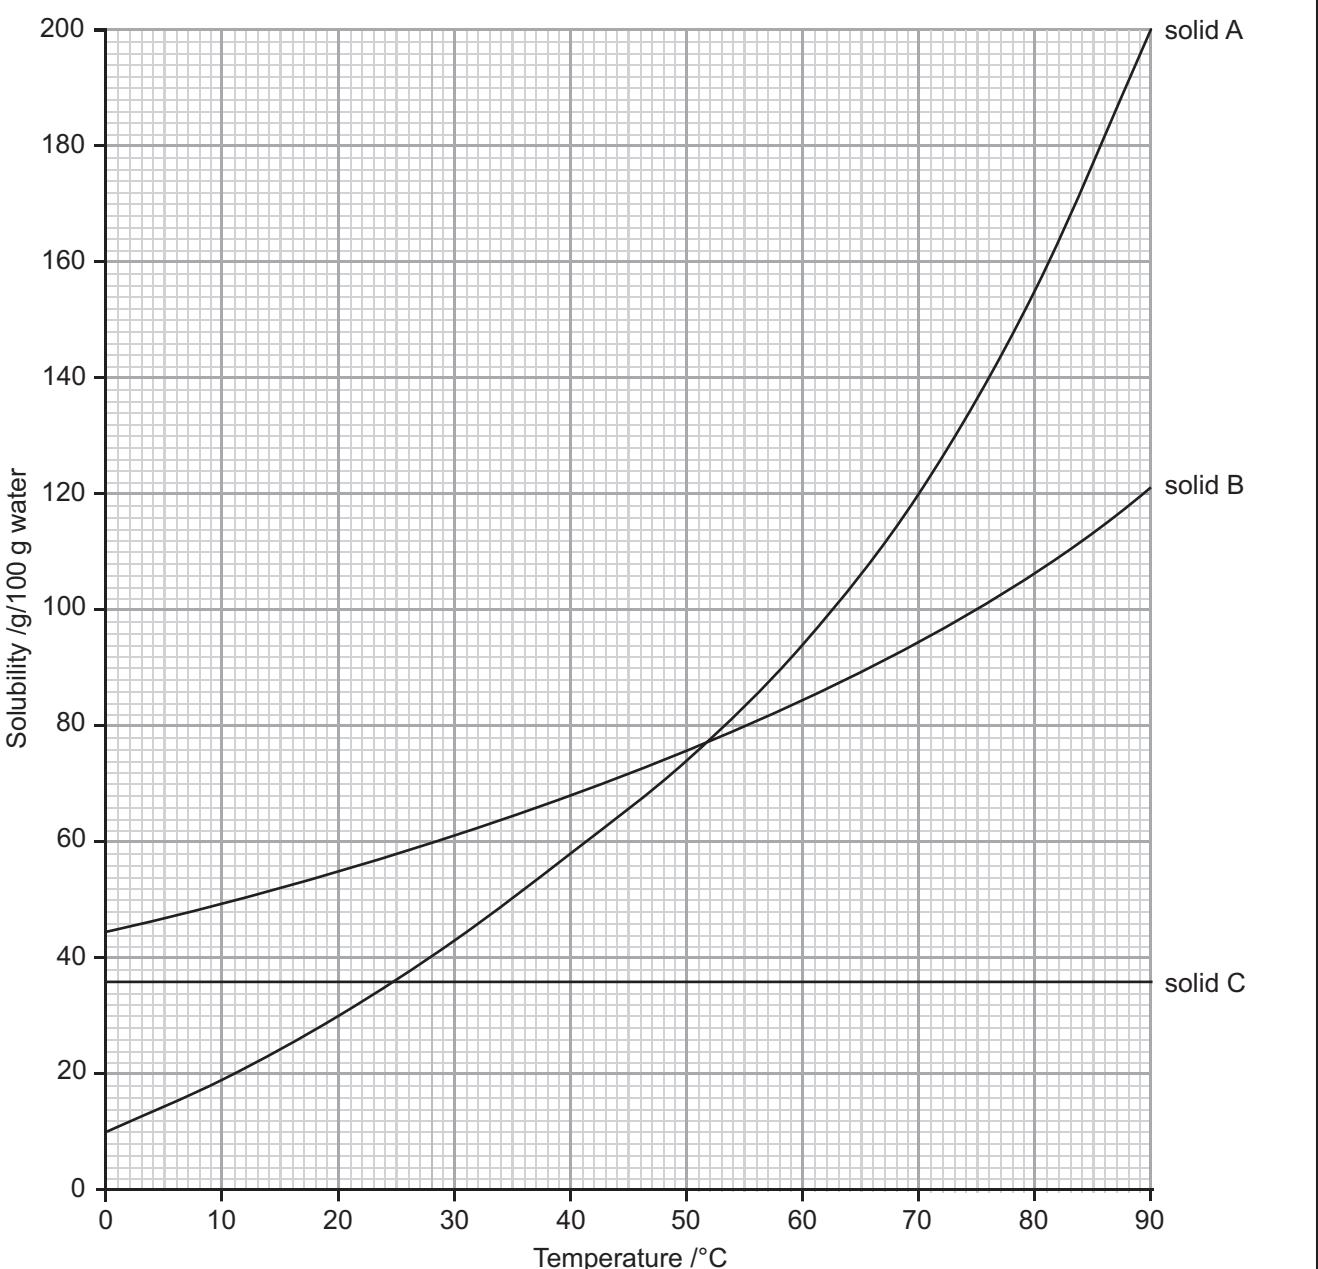

- (c) Sodium reacts vigorously with fluorine to form sodium fluoride. Write a balanced symbol equation for this reaction.

[3]

[Turn over

6 The graph shows the solubility curves for three different solids, A, B and C.

13537

20GCM1116

- (a) Compare the effect of increasing temperature on the solubility of solid A and solid C.

[1]

- (b) What is the solubility of solid B at 55 °C?

$$\text{solubility} = \underline{\hspace{5cm}} \text{ g/100 g water} [1]$$

- (c) Calculate the mass of solid needed to prepare a saturated solution of solid A in 25g of water at 70 °C.

$$\text{mass of solid A} = \underline{\hspace{5cm}} \text{ g} [2]$$

SYMBOLS OF SELECTED IONS

Positive ions

Name	Symbol
Ammonium	NH_4^+
Chromium(III)	Cr^{3+}
Copper(II)	Cu^{2+}
Iron(II)	Fe^{2+}
Iron(III)	Fe^{3+}
Lead(II)	Pb^{2+}
Silver	Ag^+
Zinc	Zn^{2+}

Negative ions

Name	Symbol
Butanoate	$\text{C}_3\text{H}_7\text{COO}^-$
Carbonate	CO_3^{2-}
Dichromate	$\text{Cr}_2\text{O}_7^{2-}$
Ethanoate	CH_3COO^-
Hydrogencarbonate	HCO_3^-
Hydroxide	OH^-
Methanoate	HCOO^-
Nitrate	NO_3^-
Propanoate	$\text{C}_2\text{H}_5\text{COO}^-$
Sulfate	SO_4^{2-}
Sulfite	SO_3^{2-}

SOLUBILITY IN COLD WATER OF COMMON SALTS, HYDROXIDES AND OXIDES

Soluble

All sodium, potassium and ammonium salts

All nitrates

Most chlorides, bromides and iodides

EXCEPT silver and lead chlorides, bromides and iodides

Most sulfates EXCEPT lead and barium sulfates

Calcium sulfate is slightly soluble

Insoluble

Most carbonates

EXCEPT sodium, potassium and ammonium carbonates

Most hydroxides

EXCEPT sodium, potassium and ammonium hydroxides

Most oxides

EXCEPT sodium, potassium and calcium oxides which react with water
