Chemistry				
Advanced Subsidiary PAPER 2: Core Organic and Physical Chemistry				
Candidates must have: Scientific calculator Data Booklet Ruler Total Marks				

Instructions

- Use **black** ink or **black** ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- For the question marked with an **asterisk** (*), marks will be awarded for your ability to structure your answer logically, showing the points that you make are related or follow on from each other where appropriate.
- A Periodic Table is printed on the back cover of this paper.

Advice

- Read each question carefully before you start to answer it.
- Show all your working in calculations and include units where appropriate.
- Check your answers if you have time at the end.
- Good luck with your examination.

Turn over ▶

BLANK PAGE

Answer ALL questions.

Some questions must be answered with a cross in a box \boxtimes . If you change your mind about an answer, put a line through the box \boxtimes and then mark your new answer with a cross \boxtimes .

1 The structures of two isomers are shown.

What kind of isomerism is shown by these molecules?

- A carbon chain
- **B** positional
- \boxtimes **C** E/Z
- **D** cis/trans

(Total for Question 1 = 1 mark)

2 Phosphorus(V) chloride, PCl₅, can be thermally decomposed to phosphorus(III) chloride, PCl₃, and chlorine, Cl₂. The equation for this reaction is

$$PCl_5(g) \rightarrow PCl_3(g) + Cl_2(g)$$

The enthalpy change for this reaction cannot be measured directly.

(a) (i) Complete the Hess's Law cycle to include the enthalpy change of formation of both phosphorus chlorides.

Include the labels of the missing enthalpy changes.

 $\Delta_v H$ is the enthalpy change for the vaporisation of the substance from the state shown to the gaseous state.

(3)

(ii) Calculate the enthalpy change for the thermal decomposition of $PCl_5(g)$ to $PCl_3(g)$ and $Cl_2(g)$, using the data given in the table. Include a sign and units in your answer.

(2)

	Enthalpy change / kJ mol ⁻¹
$\Delta_{\rm f}H$ [PCl ₅ (s)]	-443.5
$\Delta_{f}H\left[PCl_{3}(l)\right]$	-319.7
$\Delta_{v}H$ [PCl ₅ (s)]	+64.9
$\Delta_{v}H\left[PCl_{3}(l)\right]$	+30.5

(b) Another source gave a different value for the enthalpy change of this reaction.

$$PCl_5(g) \rightleftharpoons PCl_3(g) + Cl_2(g)$$
 $\Delta_r H = +87.9 \text{ kJ mol}^{-1}$

Explain the effect, if any, of increasing the temperature on the position of the equilibrium at constant volume.

-//	\neg	٠,
	- 11	-1

(Total for Question 2 = 7 marks)

3 The Maxwell-Boltzmann distribution of molecular energies for the reactant molecules in an uncatalysed reaction is shown.

Which of these Maxwell-Boltzmann distributions would you expect for the same molecules in the presence of a catalyst at the same temperature and pressure? All diagrams are drawn to the same scale.

(Total for Question 3 = 1 mark)

BLANK PAGE

- **4** When solid calcium sulfate dihydrate, $CaSO_4 \cdot 2H_2O$, is heated in a crucible, it forms solid calcium sulfate hemihydrate, $CaSO_4 \cdot \frac{1}{2}H_2O$.
 - (a) Write an equation, including state symbols, for this reaction.

(1)

(b) Which two terms could be used to describe this reaction?

(1)

		Enthalpy change	Type of process	
×	A	endothermic	hydration	
×	В	exothermic	hydration	
×	C	exothermic	dehydration	
X	D	endothermic	dehydration	

(c) When water is added to calcium sulfate hemihydrate, there is a rise in temperature.

A student decided to investigate this reaction using the following procedure:

- Step 1 10 cm^3 of distilled water is measured using a measuring cylinder having an uncertainty of $\pm 0.5 \text{ cm}^3$, and is placed in an insulated cup with a lid.
- Step **2** A thermometer with an uncertainty of ± 0.5 °C is placed in the water.
- Step **3** Exactly 10.00 g of calcium sulfate hemihydrate is weighed out using a balance with an uncertainty of ± 0.005 g.
- Step **4** The weighed quantity of calcium sulfate hemihydrate is added to the water in the insulated cup.
- Step **5** The mixture in the insulated cup is stirred until no further temperature change is observed.

Results

Temperature of the water before adding the solid = 23.5 °C

Maximum temperature of the mixture after adding the solid = 26.3 °C

Other data

Molar mass of calcium sulfate hemihydrate, $CaSO_4$ · $\frac{1}{2}H_2O$ = 145.2 g mol⁻¹

Density of water $= 1.00 \text{ g cm}^{-3}$

(i) Calculate the minimum volume of water needed to convert 10.00 g of $CaSO_4 \cdot \frac{1}{2}H_2O$ into $CaSO_4 \cdot 2H_2O$.

(2)

(ii) Calculate the enthalpy change, in kJ mol⁻¹, for this reaction. Include a sign in your answer and give your answer to an appropriate number of significant figures.

Assume that the liquid has a mass of 10.00 g and a specific heat capacity of 4.18 J g⁻¹ $^{\circ}$ C⁻¹.

(4)

(iii) Deduce which measurement has the greatest uncertainty in this experiment. Justify your answer by calculating the percentage uncertainty of this piece of apparatus.

(2)

(Total for Question 4 = 10 marks)

- **5** This question concerns the combustion of fossil fuels in power stations.
 - (a) One type of power station uses the combustion of methane gas to generate power.

Write an equation for the incomplete combustion of methane gas to form carbon monoxide and water only. State symbols are not required.

- (b) One of the problems associated with the combustion of some fossil fuels is the production of acidic gases, including the oxides of nitrogen and sulfur.
 - (i) Explain how oxides of sulfur and nitrogen can be formed from the combustion of fossil fuels.

- 1	1	╗	٦
- 1	L	_	J
	ď.	_	ı

(ii) Some power stations use a process of flue gas desulfurisation (FGD) to remove sulfur oxides from the gaseous combustion products.

One such process, known as wet scrubbing, uses a mixture of calcium carbonate and water to react with sulfur dioxide.

Two relevant equations are

$$SO_2(g) \ + \ CaCO_3(s) \ \rightarrow \ CaSO_3(s) \ + \ CO_2(g)$$

$$CaSO_3(s) \ + \ 2H_2O(l) \ + \ {}^{1\!\!/}_2O_2(g) \ \rightarrow \ CaSO_4 \cdot 2H_2O(s)$$

Explain why this process is an incomplete solution to the problem of burning fossil fuels.

Use the equations provided to illustrate your answer.

(2)

(c)	Draw a dot-and-cross diagram for su	fur dioxide, showing outer electrons only.
-----	-------------------------------------	--

(1)

(Total for Question 5 = 7 marks)

6 This question is about halogenoalkanes.

2-chloro-2-methylpropane can be hydrolysed by water.

The equation for this reaction is

$$(CH_3)_3CCl + H_2O \rightarrow (CH_3)_3COH + H^+ + Cl^-$$

The graph shows how the concentration of 2-chloro-2-methylpropane changes with time during an investigation of this reaction.

(a) Calculate the rate of reaction at 50 s. Show your working on the graph. Include units with your final answer.

(3)

Rate of reaction at 50 s =

(b) What is the classification of the mechanism for the hydrolysis of 2-chloro-2-methylpropane by water?

(1)

- A addition
- **B** elimination
- C free radical substitution
- **D** nucleophilic substitution

- (c) The letters X, Y and Z refer to three different halogenoalkanes:
 - X 1-bromobutane
 - Y 2-bromobutane
 - Z 2-bromo-2-methylpropane

 $1\,\mathrm{cm^3}$ of each of these halogenoalkanes was added to separate test tubes containing $5\,\mathrm{cm^3}$ of ethanol and $5\,\mathrm{cm^3}$ of aqueous silver nitrate solution in a water bath at $50\,\mathrm{^{\circ}C}$.

(i) State the visible change in the reaction of an ethanol/silver nitrate solution with halogenoalkane X.
Include the **formula** of the compound responsible for this observation.

(2)

(ii) The three halogenoalkanes were placed in order of **decreasing** rate of reaction. Which is the correct sequence?

(1)

- B Z, X, Y
- C Z, Y, X
- D X, Y, Z

- (d) Under different conditions, 2-chloro-2-methylpropane can react to produce 2-methylpropene, $(CH_3)_2C = CH_2$.
 - (i) State the reagent and conditions needed for this reaction.

(2)

(ii) Draw the displayed formula for the repeat unit of a polymer that is made by the polymerisation of 2-methylpropene, $(CH_3)_2C = CH_2$.

(1)

(iii) Draw a mechanism for the addition of hydrogen bromide, HBr, to 2-methylpropene to form 2-bromo-2-methylpropane.

Include curly arrows, and any relevant dipoles and lone pairs.

(4)

(Total for Question 6 = 14 marks)

7 This question is about the solubility of some alcohols.
The table shows the solubility in water of the first six alcohols in a homologous series.

Alcohol	Solubility / g dm⁻³	
methanol	soluble in all proportions	
ethanol	soluble in all proportions	
propan-1-ol	soluble in all proportions	
butan-1-ol	632	
pentan-1-ol	22	
hexan-1-ol	5.9	

(a) State what is meant by a homologous series.

You may use the alcohols in the table to illustrate your answer.

(1)

(b) Explain why methanol and water are 'soluble in all proportions'.

You must include a diagram in your answer.

(3)

(Total for Question 7 = 4 marks)

8 This question is about some reactions of cyclohexanol.

(a) Write the ${\bf skeletal}$ formula of compound ${\bf A}$.

(1)

(b) (i) Give the name **and** displayed formula of compound **B**.

(ii) The infrared (IR) spectra of cyclohexanol and compound **B** are shown.

IR Spectrum of cyclohexanol

IR Spectrum of compound **B**

Identify the bonds, using both IR spectra, that help to confirm the reaction of cyclohexanol to produce compound B.

Your answer must include the wavenumber ranges of any relevant bonds.	(2
---	----

(iii) The mass spectrum of compound ${\bf B}$ is shown.

Deduce the relative molecular mass of compound ${\bf B}$ using the mass spectrum. Justify your answer.

(1)

(iv) In the mass spectrum of cyclohexanol, there is a peak at m/z = 83.

Give the formula of a fragment that could be responsible for this peak.

(c) (i) Cyclohexanol can be converted to cyclohexene. What is the classification for this reaction?

(1)

- A addition
- **B** elimination
- C oxidation
- **D** substitution
- (ii) In an experiment, $10.0\,\mathrm{cm^3}$ of cyclohexanol was converted to cyclohexene with a $63.0\,\%$ yield.

Compound	Molar mass / g mol ⁻¹	Density / g cm ⁻³
cyclohexanol	100	0.962
cyclohexene	82.0	0.811

Calculate the volume of cyclohexene produced.

(4)

	 *(iii) Cyclohexene can be prepared by reacting cyclohexanol with phosphoric(V) acid. The mixture is warmed in a water bath for 15 minutes before distilling off a mixture of cyclohexene and water. Devise a procedure to obtain a pure, dry sample of cyclohexene from the distillate. Include a reason for each step. 	
	[Boiling temperature of cyclohexene = $83 ^{\circ}$ C Density of cyclohexene = $0.811 \mathrm{g cm^{-3}}$]	
		(6)

(Total for Question 8 = 19 marks)

9 An equation for the formation of ammonia using the Haber process is shown.

$$N_2(g) \ + \ 3H_2(g) \ \rightleftharpoons \ 2NH_3(g)$$

(a) (i) Calculate the enthalpy change for the forward reaction shown in the equation, selecting from the bond enthalpies in the table.

Include a sign in your answer.

(3)

Bond	Mean bond enthalpy / kJ mol ⁻¹
N—N	158
N=N	410
N≡N	945
N—H	391
Н—Н	436

(ii) A data book gives the standard enthalpy change of formation of ammonia as $-46.1 \, \text{kJ} \, \text{mol}^{-1}$.

Give two reasons for the difference between this value and the value that you calculated in (a)(i).

(2)

Reason 1

Reason 2

(iii) What is the percentage atom economy, by mass, for ammonia in the forward reaction?

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$

(1)

- **A** 17.6%
- **■ B** 50.0%
- **D** 100 %

(iv) What is the equilibrium expression for K_c ?

$$A K_c = \frac{[N_2][3H_2]}{[2NH_3]}$$

(1)

- **B** $K_c = \frac{[2NH_3]}{[N_2][3H_2]}$

(b) In the chemical industry, many processes involve reversible reactions. The is often removed before equilibrium is attained.	e product
Give three reasons why the product may be removed before its maximu concentration is achieved.	m
	(3)

(c)	Ammonia	ic stable in	air hut car	n be oxidised	on the	surface of a	conner	catalyst
(C)	Allillollia	is stable ii	i ali but cai	i be oxidised	on the	surface of a	i coppei	catalyst

An equation for this reaction is

$$4NH_3(g) + 5O_2(g) \rightarrow 6H_2O(g) + 4NO(g)$$
 $\Delta_r H = -905.2 \text{ kJ mol}^{-1}$

The catalyst is usually warmed to approximately 300 °C to start the reaction, but after a short reaction time the copper catalyst often melts.

(i) Give a reason why the catalyst is warmed and a reason why the catalyst may melt.
