Materials
For this paper you must have:
• a ruler
• a calculator
• the Chemistry Data Sheet and Physics Equations Sheet booklet (enclosed).

Instructions
• Use black ink or black ball-point pen.
• Fill in the boxes at the top of this page.
• Answer all questions.
• You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
• Do all rough work in this book. Cross through any work you do not want to be marked.

Information
• The marks for questions are shown in brackets.
• The maximum mark for this paper is 90.
• You are expected to use a calculator where appropriate.
• You are reminded of the need for good English and clear presentation in your answers.
• Question 6(a) should be answered in continuous prose.
  In this question you will be marked on your ability to:
  – use good English
  – organise information clearly
  – use specialist vocabulary where appropriate.

Advice
• In all calculations, show clearly how you work out your answer.
Biology Questions

1  Figure 1 shows an animal cell.

1 (a) Describe what is inside the nucleus. [2 marks]

_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________

1 (b) Give one function of the nucleus. [1 mark]

_____________________________________________________________________________________
_____________________________________________________________________________________

Scientists investigated the distribution of one type of lichen growing on the bark of red fir trees and white fir trees.

The scientists used a sampling square called a quadrat to estimate the percentage cover of lichen.

Each quadrat was divided into 25 smaller squares.

Only the squares in which the lichen covered more than half the square were counted. This number of squares was then used to calculate the percentage cover of lichen in the whole quadrat.

Figure 2 shows the lichen growing in one quadrat.

Figure 2

Key

No lichen
Lichen

2 (a) Count the number of squares in which the lichen covered more than half the square.

Use this number to calculate the percentage cover of lichen in the quadrat shown in Figure 2.

[2 marks]

______________________________________________________________

______________________________________________________________

______________________________________________________________

Percentage cover = ___________________ %

Question 2 continues on the next page
2 (b) The scientists:
- sampled 20 red fir trees and 20 white fir trees
- measured the percentage cover of lichen three times on the north-east, south-east, south-west and north-west sides of each tree
- calculated the mean percentage cover for each side.

**Figure 3** shows the sides of the trees sampled.

![Figure 3](image)

**Figure 4** shows the scientists’ results.

![Figure 4](image)
(b) (i) Look at Figure 4.

Where on the trees was there the most lichen? [1 mark]

Tick (✓) one box.

North side

South side

East side

West side

(b) (ii) The direction the bark is facing affects the distribution of the lichen growing on the trees.

Give one other conclusion that can be made from Figure 4. [1 mark]

_____________________________________________________________________________________

_____________________________________________________________________________________

(b) (iii) Suggest two factors that could affect the distribution of the lichen growing on the trees. [2 marks]

1 ___________________________________________________________________________________

2 ___________________________________________________________________________________

Turn over for the next question
Japanese knotweed is an invasive plant species that was brought into Britain from Japan in 1847. Since then, Japanese knotweed has spread widely. It has caused some native British plants to die out.

**Figure 5** shows how Japanese knotweed has spread across the British Isles between 1920 and 2011.

Japanese knotweed can survive in conditions where there are high concentrations of sulfur dioxide or high temperatures. In Japan a number of different organisms prevent it from growing out of control.

Japanese knotweed grows strong shoots which can grow through tarmac and concrete. The shoots can grow a metre every month and reach a height of 3 or 4 metres. The plant forms a wide underground network of stems that grow more shoots.

It is very difficult to kill Japanese knotweed. Cutting back new growth takes years to kill the plant. Weed killers can be used, or specialised companies try to dig it all up, but any small stem left in the soil will grow into a new plant.
3 (a) What name is given to organisms that can survive in extreme conditions?  

_____________________________________________________________________________________

3 (b) Suggest why native British plants have died out in areas where Japanese knotweed grows.  

_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________

3 (c) Only female Japanese knotweed plants grow in Britain. They are all formed from the original plant.  

What process must have produced all the Japanese knotweed plants in Britain?  

_____________________________________________________________________________________

3 (d) Scientists are investigating the use of an insect from Japan to eat the knotweed and control its growth. Scientists think that the insect will eat only knotweed.  

The insect dies in the winter in Britain, so new insects would have to be brought in each year.  

Give the advantages and disadvantages of using an insect from Japan to control the growth of Japanese knotweed.

Chemistry Questions

4 This question is about plant oils.

4 (a) Lavender oil can be separated from lavender plants by steam distillation. **Figure 6** shows the apparatus used in steam distillation.

**Figure 6**

![Diagram of steam distillation apparatus](image)

At B, the lavender oils are vaporised.

4 (a) (i) What is produced at A? [1 mark]

_____________________________________________________________________________________

4 (a) (ii) Which process happens at C? [1 mark]

_____________________________________________________________________________________

4 (a) (iii) Describe what happens at D. [1 mark]

_____________________________________________________________________________________

_____________________________________________________________________________________
4 (b) Olive oil is separated by a different method. 

**Figure 7** shows the apparatus used.

What is the name of this method? 

[1 mark]

---

**Question 4 continues on the next page**
Evidence suggests that unsaturated oils are healthier to eat than saturated oils.

A student investigated the amount of unsaturation in different samples of olive oil using bromine water.

4 (c) (i) What is the colour change when bromine water reacts with an unsaturated oil?

Complete the sentence. [1 mark]

Bromine water changes from ____________________________ to colourless.

4 (c) (ii) Figure 8 shows the apparatus the student used.
Table 1 shows the student’s results.

<table>
<thead>
<tr>
<th>Olive oil sample</th>
<th>Number of drops of bromine water added until olive oil changes colour</th>
</tr>
</thead>
<tbody>
<tr>

_____________________________________________________________________________________ 
_____________________________________________________________________________________ 

Turn over for the next question
5 This question is about the Earth and its atmosphere.

5 (a) (i) The Earth has existed for about 4.6 billion years.

The gases in the early atmosphere came from intense volcanic activity.

When did this volcanic activity happen? [1 mark]

_____________________________________________________________________________________
_____________________________________________________________________________________

5 (a) (ii) On which parts of the Earth’s crust are most volcanoes located today? [1 mark]

_____________________________________________________________________________________
_____________________________________________________________________________________

5 (b) (i) Table 2 shows the percentages of carbon dioxide, nitrogen and oxygen in the Earth’s early atmosphere and in the atmosphere today.

Complete Table 2 to show the percentages of nitrogen and oxygen in the atmosphere today. [1 mark]

<table>
<thead>
<tr>
<th>Gas</th>
<th>Percentage (%) of gas in early atmosphere</th>
<th>Percentage (%) of gas in atmosphere today</th>
</tr>
</thead>
<tbody>
<tr>
<td>Carbon dioxide</td>
<td>95</td>
<td>0.04</td>

<td></td>
</tr>
<tr>
<td>Oxygen</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>
5 (b) (ii) The percentage of carbon dioxide has decreased from the early atmosphere to the atmosphere today.

Give two reasons why. [2 marks]

_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________

Turn over for the next question
The National Grid is used to distribute electricity from power stations to consumers. Figure 9 shows the main parts of the National Grid.

Describe how electrical energy from the power station is distributed to consumers via the National Grid.

In your answer you should explain why the National Grid includes transformers A and B.

[6 marks]
Some cables in the National Grid are placed underground.

Give one advantage of using underground cables instead of overhead cables. [1 mark]

Some people who live near overhead cables are concerned about the possible effects on their health.

Suggest what should be done to investigate these concerns. [2 marks]
Solar cells can be used to generate electricity.

A student made a hypothesis:

'The output voltage from a solar cell increases with the intensity of the light that falls on the solar cell.'

Figure 10 shows the equipment the student used to test her hypothesis.

The student placed the solar cell at different distances from the light source.

For each position of the solar cell the student measured:
- the distance from the light source to the solar cell
- the output voltage.

7 (a) Give one control variable in this investigation. [1 mark]
7 (b) Figure 11 shows the results of the investigation.

![Graph of distance vs. output voltage](image)

7 (b) (i) Draw a line of best fit on the graph in Figure 11.  

[1 mark]

7 (b) (ii) Does the graph support the student’s hypothesis?  

Justify your answer.  

[2 marks]

Biology Questions

8 (a) People with Type 1 diabetes do not produce the hormone insulin. These people need to inject themselves with insulin.

Describe how a bacterial cell is genetically engineered to produce human insulin. [3 marks]
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________ 

8 (b) Vitamin A deficiency is common in large areas of the world where rice is the main food. Every year about 500 000 children become blind due to vitamin A deficiency.

Scientists have genetically engineered rice plants to produce rice that is rich in a chemical that is converted to vitamin A in the body. The rice is called Golden rice, because the rice grains are gold in colour.

Golden rice could save the sight of many children, but some people think we should not grow Golden rice.

Why might some people object to Golden rice being grown?
Suggest three reasons. [3 marks]

_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
_____________________________________________________________________________________
There are many peppered moths all over Britain. Birds eat peppered moths. Before 1848 there were only light-coloured peppered moths. The first dark-coloured peppered moth was seen in 1848. Figure 12 shows the two forms of peppered moth on the bark of trees in a polluted area and in an unpolluted area.

The dark form of peppered moth was caused by a mutation.

9 (a) What is a mutation? [1 mark]

________________________________________________________________________
________________________________________________________________________

9 (b) Scientists investigated the effect of predation by birds on the light-coloured and dark-coloured moth populations in an unpolluted area.

The scientists:
- surveyed the proportion of the two forms of moth in an unpolluted area where the bark of trees was a light colour
- one evening, released light-coloured and dark-coloured moths onto the trees in the same proportion as was occurring naturally
- counted the number of light-coloured and dark-coloured moths that were alive on the trees 4 hours after dawn the next day.

This investigation was repeated over 6 years.
The number of moths released each year was in the same proportion as was occurring naturally in the area.

**Table 3** shows the numbers of moths released each year.

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of light-coloured moths released</th>
<th>Number of dark-coloured moths released</th>
</tr>
</thead>
<tbody>
<tr>
<td>2002</td>

Chemistry Questions

10 (a) Poly(propene) is produced by polymerising propene.

10 (a) (i) Complete the equation for the polymerisation reaction.

\[
\begin{align*}
&\text{H} & \text{H} \\
&\text{n} & \text{C} = \text{C} & \rightarrow \\
&\text{H} & \text{CH}_3
\end{align*}
\]

[3 marks]

10 (a) (ii) Propene is produced from naphtha, a fraction from crude oil.

Naphtha contains decane. Decane can be converted into smaller, more useful molecules by cracking.

Complete the chemical equation to show how propene is produced from decane (C\textsubscript{10}H\textsubscript{22}).

\[
\begin{align*}
\text{C}_{10}\text{H}_{22} & \rightarrow \text{C}_5\text{H}_{12} + \text{ } + \text{ }
\end{align*}
\]

[2 marks]

10 (a) (iii) Describe the conditions needed to crack decane.
