**TUESDAY 21 MAY, AFTERNOON** 

## TIME

1 hour 30 minutes.

### **INSTRUCTIONS TO CANDIDATES**

Write your Centre Number and Candidate Number in the spaces provided at the top of this page. **You must answer the questions in the spaces provided.** 

Do not write outside the boxed area on each page or on blank pages.

Complete in black ink only. Do not write with a gel pen.

Answer all seven questions.

#### **INFORMATION FOR CANDIDATES**

The total mark for this paper is 75.

Section A carries 60 marks. Section B carries 15 marks.

Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

You are reminded of the need for good English and clear presentation in your answers.

Use accurate scientific terminology in all answers.

You should spend approximately 20 minutes on Section B.

You are expected to answer Section B in continuous prose.

Quality of written communication will be assessed in Section B.

# **Section A**

1 (a) The table below describes some events during meiosis. State the name of each stage and identify the division of meiosis involved.

Description	Stage of meiosis	Division
Microtubules of spindle contract, pulling chromosomes to opposite poles of the cell		
Single chromosomes align along the cell equator		
Chiasmata occur between bivalents		
<u> </u>	1	[6]

An investigation was carried out to determine the percentages of different types of membranes which were found in mammalian liver and pancreas cells. The results are shown in the table below.

Type of membrane	Percentage of total cell membrane/%			
Type of membrane	Liver cells	Pancreas cells		
Plasma	2	5		
Rough ER	35	60		
Smooth ER	16	0.5		
Golgi apparatus	7	10		
Secretory vesicle	0	3		

Both liver and pancreas cells produce relatively large amounts of protein. Proteins produced in a cell may be used within the cell or released from the cell for use elsewhere.

,	two cell types produces more proteins to be released from the cell. Explain your answer.
	[3]

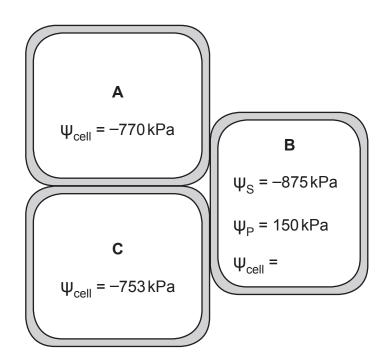

(ii)	As well as producing proteins, liver cells also synthesise large amounts of cholesterol and phospholipids. Identify the evidence for this from the table opposite.

(b)	Movement of water may also occur between red blood cells and the plasma that surrounds them.
	In terms of water potential, describe and explain the effect on red blood cells if the surrounding plasma becomes too dilute.
	[2

[Turn over

12021

(c) One function of mammalian kidneys is the regulation of the water potential of the blood. If the kidneys are not functioning correctly, dialysis may be needed. This involves blood passing through a dialysis machine, where it flows in close proximity to a liquid referred to as dialysis fluid. The blood and the dialysis fluid are separated by a semi-permeable membrane.

Rewards

[2]

The table below shows the concentrations of some of the substances present in the blood plasma entering the dialysis machine and in the dialysis fluid at the start of dialysis.

Substance	Concentration/mg dl <sup>−1</sup>			
Substance	Blood plasma	Dialysis fluid		
sodium	2520	2520		
chloride	1800	1800		
urea	30	0		
creatine	5	0		
glucose	100	100		

Determine which substance will show the greatest rate of diffusion from

	blood plasma to dialysis fluid.	
		[1]
(ii)	Explain why it is necessary to ensure that the concentration of glucose in the dialysis fluid is the same as that in the blood plasma.	

The composition of the dialysis fluid leaving the machine is monitored during treatment. Occasionally a red colouration appears in the dialysis fluid.	
(iii) Suggest an explanation for the appearance of this red colouration in the dialysis fluid.

12021

(c) Hand sanitisers containing alcohol can be used to destroy bacteria (prokaryotes) on the skin. However, at very high concentrations, alcohol can have a drying effect which may damage the skin.

An investigation was carried out into the effect of alcohol concentrations on membrane permeability. Beetroot tissue was used rather than prokaryotes, since the release of a red pigment from beetroot cells can be a measure of membrane permeability.

Sections of beetroot tissue were placed in different concentrations of alcohol and the absorbance of the surrounding solution was measured using a colorimeter. The results are shown in the graph below.

(i)	Calculate the percentage increase in absorbance when alcohol concentration was increased from 80% to 100%.	
	(Show your working.)	
		[2]
		[4]
(ii)	Describe and suggest an explanation for the trend shown by the data in the graph.

Lactose intolerance is a common digestive problem in which the body is unable to digest lactose, a sugar mainly found in milk and other dairy products.

Rowarding 200

20

G:

D

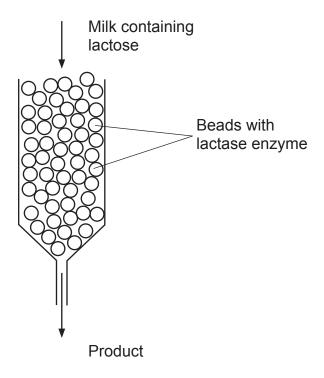

D

Dearring

The enzyme lactase breaks down lactose into two sugars, glucose and galactose, which are easily absorbed into the bloodstream.

People with lactose intolerance don't produce enough lactase. The result is that lactose stays in the digestive system and is fermented by bacteria. Symptoms of lactose intolerance include stomach cramps and bloating.

One method of easing these symptoms is to use lactose-free milk. This milk has been treated with lactase to remove most of the lactose present. This is done in an industrial reactor using immobilised enzymes. The diagram below illustrates how this is carried out.

; <b>)</b>	(i)	State <b>one</b> advantage of the lactase enzyme being immobilised during this process.	
			[
	(ii)	The process of removing lactose from milk is carried out at relatively low temperatures such as 5°C. Suggest <b>one</b> advantage and <b>one</b> disadvantage of using this temperature.	ge
		Advantage	
		Disadvantage	
			[
	(iii)	Suggest why it may be necessary at this temperature to pass the milk through the reactor several times.

Every week during 'flu season' the Public Health Agency for Northern Ireland produces data relating to GP consultations for the flu virus. The graph below shows this data for three years (2015–2018) from the beginning of October until the end of February.
