

ADVANCED General Certificate of Education 2022

Biology

Assessment Unit A2 2 assessing Biochemistry, Genetics and Evolutionary Trends

Centre Number

Candidate Number

[ABY21]

ABY21

THURSDAY 16 JUNE, MORNING

TIME

2 hours 15 minutes.

INSTRUCTIONS TO CANDIDATES

Write your Centre Number and Candidate Number in the spaces provided at the top of this page.

You must answer the questions in the spaces provided.

Do not write outside the boxed area on each page or on blank pages.

Complete in black ink only. Do not write with a gel pen.

Answer **all nine** questions.

INFORMATION FOR CANDIDATES

The total mark for this paper is 100. Section A carries 82 marks. Section B carries 18 marks. Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

You are reminded of the need for good English and clear presentation in your answers. Use accurate scientific terminology in all answers.

You should spend approximately 25 minutes on Section B.

You are expected to answer Section B in continuous prose.

Quality of written communication will be assessed in Section B.

Statistics Sheets are not required for use with this paper.

32ABY2103

2 The photograph below shows a bee (an insect) on a flower.

© James Napier

- (a) (i) Name the phylum to which insects belong.
 - (ii) Using the photograph, identify one **visible** feature that is a distinguishing characteristic of this phylum.

_[1]

[1]

(b) Insects are the most successful animals on Earth, both in terms of number of species and number of individuals.

It is estimated that there may be as many as 5×10^6 species of insects, but only (approximately) one million have been discovered and named so far.

(i) Based on these estimates, calculate the number of insect species still to be discovered.

[1]

P.

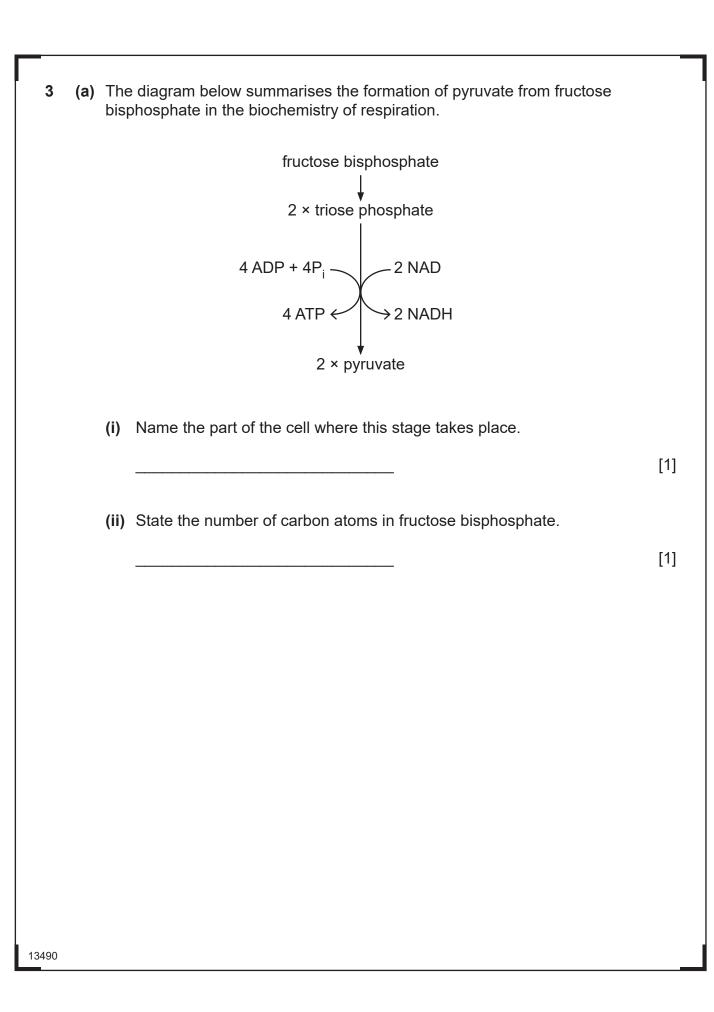

13490

32ABY2104

Suggest one reason why so many insect species have yet to be discovered.
[1]
success of insects is mainly due to their basic body plan, an ability to fly and small size.
Suggest one way in which each of the following has contributed to the success of insects.
Ability to fly
Small size
[2]
e one characteristic of Chordata which is not present in insects.
e one characteristic of Chordata which is not present in insects.

P

- **5** (a) Young calves, as with other mammals, feed almost exclusively on their mother's milk. During this developmental stage they produce enzymes to coagulate (clot) the milk they drink. This slows the movement of milk through the digestive system.
 - (i) Suggest **one** advantage of slowing the movement of milk through the gut.

The enzymes involved in clotting milk, collectively known as rennet, are used in cheese-making.

Rennet was traditionally extracted from the stomach lining of very young calves, a process which obtained a small amount of rennet from each calf.

More recently, chymosin (the most effective enzyme in rennet) has been produced using genetically engineered microorganisms (GEMs). This source of chymosin is now used in the production of up to 70% of cheese products.

(ii) Using the information provided, suggest **two** reasons why genetically engineered enzymes are increasingly being used in the cheese industry.

(b) Microsatellite repeat sequences (MRSs) are sections of DNA where a small sequence of bases is repeated many times. The number of repeats in a particular MRS varies in individuals and this difference is the basis of genetic fingerprinting. In genetic fingerprinting, the bars seen on the electrophoresis gel represent MRS fragments and as these differ between individuals, the appearance of the 'fingerprint' on the gel will also vary between individuals. When isolating MRSs from DNA, it is important that restriction endonucleases accurately cut the DNA at the start and end of each MRS. (1) Explain why a detailed knowledge of the organism's genome is necessary for this purpose.		(iii)	Using your understanding of gene technology, briefly outline how bacteria can be genetically modified to produce chymosin.
 (b) Microsatellite repeat sequences (MRSs) are sections of DNA where a small sequence of bases is repeated many times. The number of repeats in a particular MRS varies in individuals and this difference is the basis of genetic fingerprinting. In genetic fingerprinting, the bars seen on the electrophoresis gel represent MRS fragments and as these differ between individuals, the appearance of the 'fingerprint' on the gel will also vary between individuals. When isolating MRSs from DNA, it is important that restriction endonucleases accurately cut the DNA at the start and end of each MRS. (i) Explain why a detailed knowledge of the organism's genome is necessary for this purpose.

(ii) Identify the type of inheritance shown by red-green colour blindness from those listed in the bullet points at (b).

_[1]

(c) Huntington's disease and Marfan Syndrome are each caused by the presence of a dominant allele. The genes for Huntington's disease and Marfan Syndrome are on separate autosomes.

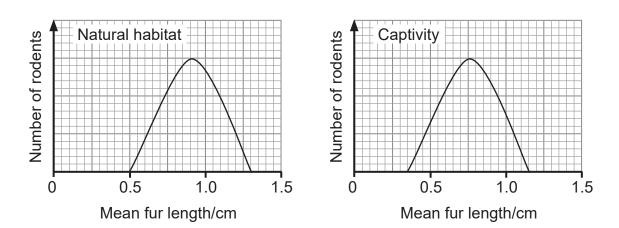

Two individuals, one heterozygous for both genes and the other heterozygous for Huntington's disease but not carrying the Marfan allele, had a child.

Using the symbols, H, h (Huntington's disease) and R, r (Marfan Syndrome), complete a genetic diagram to determine the probability that they have a child who is not affected by either condition.

D a Ð R 8 Ferns and flowering plants (angiosperms) are regarded as being more highly adapted than mosses in terms of their ability to survive in drier habitats. One adaptation of ferns and flowering plants is the presence of vascular tissue. (a) (i) Suggest one way in which having vascular tissue is an adaptation to a terrestrial habitat. _____[1] (ii) Apart from presence of vascular tissue, state two features found in both ferns and flowering plants which are adaptations to a terrestrial habitat. 1. 2. [2] (b) Mature xylem vessels do not possess end walls or cellular contents and consequently are non-living. These adaptations are necessary for xylem vessels to operate as efficient water transport channels throughout the plant. Early in their development, xylem vessels grow and lignin is deposited in their side walls. Once the walls have been lignified, the vacuoles burst and release hydrolytic enzymes. These enzymes break down the cell contents, leaving only the thickened side walls. (i) Name another cell organelle which releases hydrolytic enzymes to destroy damaged cells. [1]

13490	

C

(c) The diagram below represents a transverse section (T.S.) through part of the stem of a flowering plant. In this species, a tissue called sclerenchyma is found immediately outside the vascular bundles of stems. Like xylem vessels, sclerenchyma has cell walls which are thickened with lignin and the cells are dead at maturity with no internal contents.

(i) Sclerenchyma cells and xylem vessels are different shapes in transverse section. Using the diagram, identify **one** other way in which sclerenchyma cells differ from xylem vessels.

(ii) What does this difference suggest about the function of sclerenchyma? Explain your answer.

Section B

Quality of written communication will be assessed in this section.

- **9** Variation, fitness, selection and evolutionary change are key terms in explaining how species adapt and change over time. Evolutionary change can be particularly rapid in island populations.
 - (a) Outline the main causes of variation in living organisms.

The diagram below represents a small group of volcanic islands in the central Pacific Ocean, isolated from other land masses. In general, larger islands have a wider range of habitat types than smaller islands. The table shows some information about each of the islands.

Island	When formed/ million years ago	Number of species
A	12	202
В	12	150
С	12	190
D	7	47
E	7	35

(b) With reference to variation, fitness and selection, describe and explain how evolutionary change occurs over time and account for the differences in species number across this island group. [12]
